How are we planning to  
do this?

Key Ideas

Three Key ideas while  
Using Computational  
Resources for Data  
Analysis

Resources

Thank You

## Four key ideas while Using Computational Resources

- Break your problem into smaller chunks, solve each one of these and then glue them together
  - remember when you are writing code you are building a computational system
  - this principle holds for computational systems at all levels of complexity

Analysis

### Resources

### Thank You

- Break your problem into smaller chunks, solve each one of these and then glue them together
  - remember when you are writing code you are building a computational system
  - this principle holds for computational systems at all levels of complexity
- Make your analysis reproducible with proper documentation
  - Our analysis is for someone else to read and understand
  - Jupyter project itself started based on this principle for scientific community

- Break your problem into smaller chunks, solve each one of these and then glue them together
  - remember when you are writing code you are building a computational system
  - this principle holds for computational systems at all levels of complexity
- Make your analysis reproducible with proper documentation
  - Our analysis is for someone else to read and understand
  - Jupyter project itself started based on this principle for scientific community
- Always try to append/extend data than reducing it
  - this comes from the functional programming paradigm, which has become relevant for data analysis
  - when manipulating a data variable, don't change the existing ones but create a new data variable
  - Say, you are combining two data sets, try to extend one with another than to reduce, this way you will preserve two original data sets
